Transit Management

What We Do

Our transit practice helps agencies share transit related data and information. Transit data includes service schedules, planning data, real time information, fare data, and more.
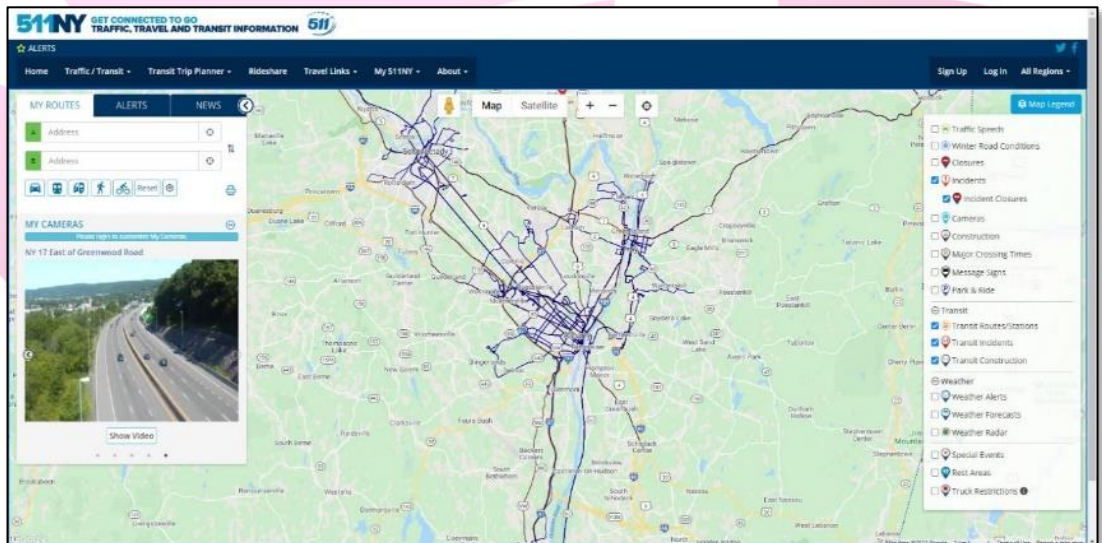

ConSysTec encourages Transit (bus and rail) operators to use data standards to achieve institutional and technical integration.

Our transit data services include:

• Develop data models and feed specifications to be used in real time transit systems.

• High level system design for real time transit information systems, including the development of Concept of Operations and System Requirements documentation.

• Collect and process transit data from transit agencies for use in regional trip planning applications. Support a transit agency's ability to translate schedule and other data into industry standard feed formats, including General Transit Feed Specification (GTFS), GTFS-realtime, and GTFS-Flex.

• Perform outreach to agencies to facilitate this process.

511NY Trip Planner Project

ConSysTec is responsible for obtaining transit schedule data from approximately one hundred transit agencies, performing quality control on the data before submitting the data to NYSDOT's 511NY Trip Planner.
